# R&D Policy

---

- All advanced economies have an “R&D policy”
- Implies a belief in “market failures”
- Requires large and varied set of indicators
- Requires consensus conceptual framework
- Protracted policy debates

# Steps in R&D Policy Analysis:

---

- **Importance** of technology
- **Indicators** of underinvestment in R&D?
  - Low rates of innovation
  - Low rates of productivity growth
  - Persistent trade balances
- **Causes** of underinvestment (market failure mechanisms)
  - Excessive discounting
  - Appropriability problems
  - Industry or market structure deficiencies
  - Inadequate infrastructure
- **Responses** (policy instruments that match the identified market failures)

# How High-Tech is the U.S. Economy?

- **Technology** accounts for more than 50 percent of **output** (GDP) growth in all OECD countries (except Canada)
- Technology (through innovation and capital deepening) accounts for 2/3 of **productivity** growth
- **Message:** R&D is a **critical policy variable** because it is the process that creates technology

# How High-Tech is the U.S. Economy?

---

## Major Economic Sector Shares of GDP and Industrial R&D Performance, 2000

Source: Bureau of Economic Analysis; National Science Foundation,  
*Research and Development in Industry—2000*, Table E-1

# How High-Tech is the U.S. Economy?

## R&D-to-Sales Trends in Manufacturing: 1983-1998

Company and Other (except Federal) R&D Funds as % of Net Sales

Source: National Science Foundation, *National Patterns of R&D Resources: Early Release Tables*, 2000

# **How High-Tech is the U.S. Economy?**

- **High-Tech Sector:**
  - Electronics
  - Pharmaceuticals
  - Communication Services
  - Software and Computer-Related Services
- **Accounts for 7 – 10 percent of GDP**
- **Message:** The other 90+ percent of the economy is susceptible to market share erosion and decline

# How High-Tech is the U.S. Economy?

## Geographic Concentration:

- Six states account for almost one-half of all R&D
- Ten states account for almost two-thirds of all R&D
- **Message:** The remaining 40 states are not a high-tech economy

# How High-Tech is the U.S. Economy?

## Geographic Distribution of U.S. R&D Performance

<b>State</b>	<b>% of Population</b>	<b>% of National R&amp;D</b>
California	12.0	20.7
Michigan	3.5	8.1
New York	6.7	6.1
Texas	7.4	5.4
Massachusetts	2.3	5.3
Pennsylvania	4.4	4.6
New Jersey	3.0	4.6
Illinois	4.4	4.2
Washington	2.1	3.6
Maryland	1.9	3.5
<b>Total</b>	<b>47.7</b>	<b>66.1</b>

# How Has the “High-Tech” Economy Performed?

---

## U.S. Trade Balances for High-Tech Products and All Goods 1988-2001 (in \$billions)

# How Has the “High-Tech” Economy Performed?

---

## Long-Term Trends in Productivity and Income: 1948-2000

Index

Source: Bureau of Labor Statistics

# How Has the “High-Tech” Economy Performed?

---

## Razor’s Edge Growth Path:

- TFP growth highly dependent on 12% of the economy producing durable goods, notably computers (Gordon)
- IT products responsible for above trend growth in late 1990s (Oliner and Sichel)
- Sharp reduction in TFP would result if semiconductor industry product life cycle returns to 3 years from recent 2 years (Jorgenson)
- **Message:** Prospects for above-trend long-term productivity growth are poor

# How Important is the Composition of R&D?

---

## The “New Economy”:

- IT (or ICT) has infrastructure character
- Need **products** and **services** from a broader high-tech sector
  - Source: IT systems based on a range of innovative products from the manufacturing sector
  - Synergy: Productivity of manufacturing benefits from IT services
  - Impact: The manufacturing sector accounts for \$1.5 trillion of GDP and 20 million jobs
- **Message**: advanced economies need a broad and deep R&D strategy, including a manufacturing focus

# How Important is the Composition of R&D?

**Trends in U.S. R&D by Major Phase of R&D, 1991-2000**  
(\$ billions)

Source: National Science Board, *Science and Engineering Indicators* – 2002

# R&D Market Failure Mechanisms

---

## Implications for Adequacy of R&D Investment:

- Inadequate **amount**
- Skewed **composition** of industrial R&D toward short-term investment objectives
- **Geographic concentration**
- **Skewed distribution** of federal R&D across emerging technologies

**Message:** the long run is here

# R&D Market Failure Mechanisms

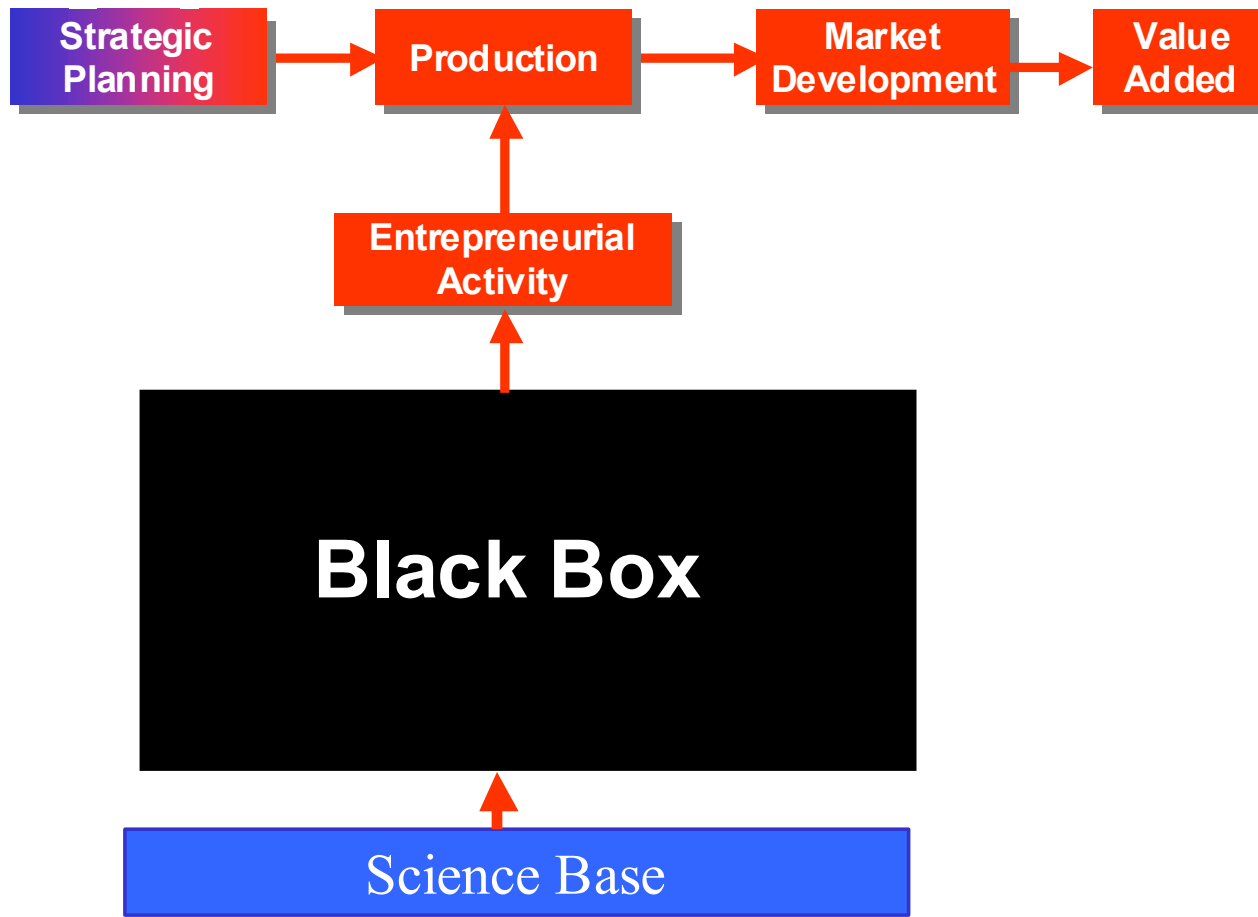

---

- (1) *Technical Complexity*
- (2) *Time*
- (3) *Capital Intensity*
- (4) *Economies of Scope*
- (5) *Spillovers*
- (6) *Technical Infrastructure*

# Technology-Based Policy Responses

# Technology-Based Policy Responses

## Relative Expenditures by Phase of R&D over Technology Life Cycle

# Technology-Based Policy Responses

---

## Critical Government Research Support Provided for Major Technology Drivers:

- Computers (Flamm)
- Communications Networks (NRC)
- Biotechnology
- Nanotechnology
- **Message:** Once identified, major emerging technologies must be disaggregated to identify public good leverage points

# Technology-Based Policy Responses

---

## What type of R&D?

---

### Costs of Inadequate Software Testing Infrastructure

Industry Coverage	Annual Cost	Potential Economic Benefits
Transportation Equipment and Financial Services	\$5.85 B	\$2.10 B
U.S. Economy	\$59.5 B	\$22.2 B

---

Source: RTI International, *The Economic Impacts of Inadequate Infrastructure for Software Testing* (NIST Planning Report 02-3)

# R&D Policy Options

---

## How much R&D?

- If all manufacturing industries invested at the same rate as the high-tech segment, this sector's R&D would increase from \$130B to roughly \$400B
- If the Federal Government spent as much on all areas of science combined as it does just on health research, its R&D budget would increase by roughly \$11B
- One recent economic study (Jones and Williams) estimated that national R&D should be increased by a factor of four

# R&D Policy Options

---

## If problem is

- Inadequate **science base**:
  - *fund basic research* at adequate scope and depth
- Inadequate **amount of R&D**:
  - *provide tax incentives* (e.g., R&E tax credit) to raise expected rates of return above corporate hurdle rates
- Distorted **composition of R&D**:
  - *Co-fund generic technology research* to create attractive corporate option pricing for portfolio of emerging technologies
